

## **IPS Ltd**

Case Study 3

Innovative products, ground breaking schemes and pioneering projects have seen IPS work in harmony with many Local Authorities, Housing Associations and private Landlords.

New Technology is at the front of the company's approach as it removes the hideous sheet steel shuttering that for many years has blighted housing schemes across the country.

Empty properties can now be protected by state of the art GSM based alarm systems, far more reliable than the old VHF Radio frequency transmissions. Following the success of the stand alone systems and following requests from various clients for some kind of visual verification method; IPS have developed another first within the Void property market. Visual verification live down a GSM link pictures of intruders within a protected property, providing evidence first hand towards a successful prosecution.

This is a massive step forward in bringing the industry out of the addictive cycle of blighting properties with Steel shuttering. Using cosmetic white clean curtain material on the front windows and the new Video Void Alarm inside the premises, a high security protective shield can be in place within minutes. With no expensive alterations to premises in order to hold the steel sheet in place and with no change in the appearance of the property this solution is one more in keeping with the 21st Century.
